Subject Index

- Access control
 - a simple way of improving the login security, 607
- Access controls
 - a path context model for addressing security in potentially non-secure environments, 417
 - access control policies: some unanswered questions, 43
- Anonymous numbered accounts
 - digital payment systems enabling security and unobservability, 399
- Applications security
 - framework of a methodology for the life cycle of computer security in an organization, 433
- Assurance
 - access control policies: some unanswered questions, 43
- Asymmetric cryptographic algorithms
 - optimized software implementations of the modular exponentiation on general purpose microprocessors, 621
- Audit
 - security and control issues in local area network design, 305
- Authentication
 - a survey of password mechanisms: weaknesses and potential improvements. Part 1, 587
 - a survey of password mechanisms: weaknesses and potential improvements. Part 2, 675
 - controls in electronic funds transfer systems: a survey and synthesis, 123
 - verification of network security protocols, 693
- Authorization
 - controls in electronic funds transfer systems: a survey and synthesis, 123
 - security in electronic funds transfer: message integrity in money transfer and bond settlements through GE Information Services' global network, 209
- Authorizations
 - access control policies: some unanswered questions, 43
- Cashless payment
 - digital payment systems enabling security and unobservability, 399
- Cellular phones
 - emerging vulnerabilities in office automation security, 223
- Certification
 - a methodology for penetration testing, 613
- Communications
 - security architecture for data transfer through TCP/IP protocols, 709
- Communications security
 - emerging vulnerabilities in office automation security, 223
- Computer security
 - models of practical defenses against computer viruses, 149
- Computer virus
 - Review of VIRUSCAN, 633
- Computer viruses
 - a mathematical theory for the spread of computer viruses, 35
 - computational aspects of computer viruses, 325
 - models of practical defenses against computer viruses, 149
 - preventing viruses in computer systems, 427
- Confidentiality
 - an introduction to the SMITE approach to secure computing, 495
- Connection-oriented and connectionless transmission
 - placement of data integrity security services in open systems interconnection architecture, 507

Subject Index

- Control
 - a methodology for penetration testing, 613
- Copyright
 - protecting ownership of proprietary information, 15
- Cryptography
 - a remark on the hash functions for message authentication, 55
 - controls in electronic funds transfer systems: a survey and synthesis, 123
- Data classification
 - SODA: a secure object-oriented database system, 517
 - the role of classification of information in controlling data proliferation in end-user personal computer environment, 59
- Data communications security
 - planning: a means to achieve data communications security, 189
- Data confidentiality
 - security architecture for data transfer through TCP/IP protocols, 709
- Data control
 - prerequisites for data control, 317
- Data integrity
 - placement of data integrity security services in open systems interconnection architecture, 507
 - prerequisites for data control, 317
- Data security
 - the role of classification of information in controlling data proliferation in end-user personal computer environment, 59
- Databases
 - prototyping to explore MLS/DBMS design, 229
- Digital banknotes
 - digital payment systems enabling security and unobservability, 399
- Digital payment systems
 - digital payment systems enabling security and unobservability, 399
- Discretionary security
 - access control policies: some unanswered questions, 43
- Distributed processing
 - security of open systems, 139
- Eavesdropping
 - emerging vulnerabilities in office automation security, 223
- EDP audit
 - prerequisites for data control, 317
- Electronic funds transfers
 - security in electronic funds transfer: message integrity in money transfer and bond settlements through GE Information Services' global network, 209
- Electronic security modules
 - controls in electronic funds transfer systems: a survey and synthesis, 123
- Electronic signature
 - smartcards outsmart computer crime, 247
- Encryption
 - protecting ownership of proprietary information, 15
 - security and control issues in local area network design, 305
 - security in electronic funds transfer: message integrity in money transfer and bond settlements through GE Information Services' global network, 209
 - smartcards outsmart computer crime, 247
- End-user environment
 - the role of classification of information in controlling data proliferation in end-user personal computer environment, 59
- Functional data model
 - a functional view of multilevel databases, 721
- Hash functions
 - a remark on the hash functions for message authentication, 55
- High assurance
 - an introduction to the SMITE approach to secure computing, 495
- Information security
 - protecting ownership of proprietary information, 15

- Information security planning
 - planning: a means to achieve data communications security, 189
- Integrity
 - an introduction to the SMITE approach to secure computing, 495
 - models of practical defenses against computer viruses, 149
- Intellectual property
 - protecting ownership of proprietary information, 15
- Internet protocol
 - security architecture for data transfer through TCP/IP protocols, 709
- ISDN
 - emerging vulnerabilities in office automation security, 223
- ISO-OSI reference model
 - placement of data integrity security services in open systems interconnection architecture, 507
- ISO-OSI transport layer
 - security architecture for data transfer through TCP/IP protocols, 709
- Key management
 - security in electronic funds transfer: message integrity in money transfer and bond settlements through GE Information Services' global network, 209
- LANS
 - emerging vulnerabilities in office automation security, 223
- Life cycle
 - framework of a methodology for the life cycle of computer security in an organization, 433
- Linkability of actions
 - digital payment systems enabling security and unobservability, 399
- Local area network
 - security and control issues in local area network design, 305
- Logical security
 - a path context model for addressing security in potentially non-secure environments, 417
- Login procedures
 - a simple way of improving the login security, 607
- Long-word arithmetics
 - optimized software implementations of the modular exponentiation on general purpose microprocessors, 621
- Management
 - framework of a methodology for the life cycle of computer security in an organization, 433
- Mathematical model of virus infection
 - a mathematical theory for the spread of computer viruses, 35
- Message authentication
 - a remark on the hash functions for message authentication, 55
 - security in electronic funds transfer: message integrity in money transfer and bond settlements through GE Information Services' global network, 209
- Message authentication code
 - placement of data integrity security services in open systems interconnection architecture, 507
- Methodology
 - framework of a methodology for the life cycle of computer security in an organization, 433
- Microprocessors
 - optimized software implementations of the modular exponentiation on general purpose microprocessors, 621
- MLS/DBMS design
 - prototyping to explore MLS/DBMS design, 229
- Modular exponentiation
 - optimized software implementations of the modular exponentiation on general microprocessors, 621
- Multilevel secure database management systems
 - a functional view of multilevel databases, 721
- Network management
 - security and control issues in local area network design, 305
- Network planning
 - security and control issues in local area network design, 305

Subject Index

- Network risks
 - security and control issues in local area network design, 305
- Network security
 - a path context model for addressing security in potentially non-secure environments, 417
 - controls in electronic funds transfer systems: a survey and synthesis, 123
 - planning: a means to achieve data communications security, 189
 - smartcards outsmart computer crime, 247
 - verification of network security protocols, 693
- Object-oriented model
 - SODA: a secure object-oriented database system, 517
- Open systems
 - security of open systems, 139
- OSI
 - security of open systems, 139
- Pass-phrases
 - a survey of password mechanisms: weaknesses and potential improvements. Part 1, 587
 - a survey of password mechanisms: weaknesses and potential improvements. Part 2, 675
- Passwords
 - a simple way of improving the login security, 607
 - a survey of password mechanisms: weaknesses and potential improvements. Part 1, 587
 - a survey of password mechanisms: weaknesses and potential improvements. Part 2, 675
- Patent
 - protecting ownership of proprietary information, 15
- Penetration testing
 - a methodology for penetration testing, 613
- PIN
 - controls in electronic funds transfer systems: a survey and synthesis, 123
- Placement of security services
 - placement of data integrity security services in open systems interconnection architecture, 507
- Privacy
 - prerequisites for data control, 317
- Protection
 - models of practical defenses against computer viruses, 149
- Protocols
 - verification of network security protocols, 693
- Prototyping
 - prototyping to explore MLS/DBMS design, 229
- Query modification
 - a functional view of multilevel databases, 721
- Risk analysis matrix
 - prerequisites for data control, 317
- RSA
 - optimized software implementations of the modular exponentiation on general purpose microprocessors, 621
- Secure database
 - SODA: a secure object-oriented database system, 517
- Security
 - prototyping to explore MLS/DBMS design, 229
- Security architecture
 - placement of data integrity security services in open systems interconnection architecture, 507
 - security architecture for data transfer through TCP/IP protocols, 709
 - security of open systems, 139
- Security constraints
 - a functional view of multilevel databases, 721
- Security entities
 - SODA: a secure object-oriented database system, 517
- Security models
 - a path context model for addressing security in potentially non-secure environments, 417
 - access control policies: some unanswered questions, 43
 - an introduction to the SMITE approach to secure computing, 495

- Security policy
 - access control policies: some unanswered questions, 43
- Sensitive object
 - a methodology for penetration testing, 613
- Smartcards
 - smartcards outsmart computer crime, 247
- Strategic business planning
 - planning: a means to achieve data communications security, 189
- Strong typing
 - an introduction to the SMITE approach to secure computing, 495
- Systems design
 - planning: a means to achieve data communications security, 189
- Tamper-resistant devices
 - digital payment systems enabling security and unobservability, 399
- Target secure environment
 - planning: a means to achieve data communications security, 189
- Technological security
 - framework of a methodology for the life cycle of computer security in an organization, 433
- Telecommunications
 - a simple way of improving the login security, 607
- Temporal logic
 - verification of network security protocols, 693
- Trade secret
 - protecting ownership of proprietary information, 15
- Transaction security
 - smartcards outsmart computer crime, 247
- Transmission control protocol
 - security architecture for data transfer through TCP/IP protocols, 709
- Trusted path
 - an introduction to the SMITE approach to secure computing, 495
 - preventing viruses in computer systems, 427
- UNIX
 - a survey of password mechanisms: weaknesses and potential improvements. Part 1, 587
 - a survey of password mechanisms: weaknesses and potential improvements. Part 2, 675
- User identification
 - smartcards outsmart computer crime, 247
- Validation
 - a methodology for penetration testing, 613
- Verification
 - a methodology for penetration testing, 613
- VIRUSCAN
 - review of VIRUSCAN, 663
- Viruses
 - emerging vulnerabilities in office automation security, 223
